

BESPOKE BY DESIGN

What is it?

SIP (Session Initiation Protocol) sounds really technical and scary, but we promise it's just new technology designed to bring your business into the future and boost efficiency.

Simply put, SIP uses your existing system to make calls through the internet rather than a traditional connection. This means if you already have a SIP address, phone and internet connection, your internal and external communications can be achieved at a cheaper rate with an exceptional connection through eve.

What does it do?

SIP provides a next generation connection between your existing phone system and eve to place internet based calls.

There is no need for new numbers or handsets and all your existing features can be retained and even improved. By providing a modern and robust connectivity solution, there is no need to compromise on quality when you make the move to eve SIP.

Why should I move to SIP?

You may have heard that in 2025, BT will be switching off its traditional phone lines and everyone will need to switch to an internet connection. So, it's time to stay ahead of the curve and review the options available for your business.

Switching to a SIP line allows you to reap the benefits of a traditional phone system and so much more. You can benefit from the following:

- Call between sites absolutely free
- Choose your numbers
- Record your calls
- Display call statistics on a screen
- Route calls to the right users
- Marketing messaging on-hold

Switching to a SIP solution brings your communications into the future.

A SIP connection is also much cheaper than traditional solutions as you will be calling through the internet, making calls more cost effective across multiple locations.
